I'm going to learn Linux OS and to use Git and GitHub to develop a web application. I have an old SamSung notebook operating under Windows OS. I'd like to erase all settings of the Windows OS in this notebook and install a new Linux OS on it. Please list all steps to achieve my goal.

Perfect, let's walk through this step by step so you can safely erase Windows and install Linux on your Samsung notebook. I'll give you a clear roadmap:

Preparation

1. **Backup important files**
 - Save any documents, photos, or data you want to keep to an external drive or cloud storage.
 - Once you erase Windows, everything will be gone.
2. **Check hardware compatibility**
 - Note your notebook's specs (CPU, RAM, storage).
 - Most modern Linux distributions (Ubuntu, Fedora, Linux Mint) run fine on older hardware, but lightweight options (Xubuntu, Lubuntu) are better for low RAM.
3. **Choose a Linux distribution**
 - **Beginner-friendly:** Ubuntu, Linux Mint.
 - **Lightweight:** Xubuntu, Lubuntu.
 - **Developer-focused:** Fedora, Debian.
 - Since you want to learn Git/GitHub and web development, Ubuntu or Linux Mint are excellent choices.

Create Installation Media

4. **Download the Linux ISO**
 - Go to the official site (e.g., ubuntu.com).
 - Download the latest stable release.
5. **Create a bootable USB drive**
 - Use a tool like Rufus (Windows) or balenaEtcher.
 - Select the ISO file and your USB drive (at least 4GB).
 - Write the image to the USB.

BIOS/UEFI Setup

6. **Enter BIOS/UEFI**
 - Restart your notebook and press the key (often F2, F10, or Del) during boot.
 - Change **boot order** so USB is first.

Queries to Als_20260515(五)

- Disable **Secure Boot** if necessary (some Linux distros require it).

Install Linux

7. Boot from USB

- Insert the USB, restart, and boot into the Linux installer.
- You'll see options like "Try Ubuntu" or "Install Ubuntu."

8. Erase Windows and install Linux

- Choose **Install**.
- When asked about installation type, select **Erase disk and install Linux**.
- This wipes Windows completely and installs Linux fresh.

9. Set up user account

- Create your username and password.
- Wait for installation to finish, then reboot.

Post-Installation Setup

10. Update system

- Open terminal and run:

```
bash
```

```
sudo apt update && sudo apt upgrade
```

(For Ubuntu/Mint; Fedora/Debian use `dnf` or `apt` accordingly.)

11. Install Git

- Run:

```
bash
```

```
sudo apt install git
```

- Configure Git:

```
bash
```

```
git config --global user.name "Your Name"
```

```
git config --global user.email "your@email.com"
```

12. Install a code editor

- Recommended: **VS Code** or **Vim**.
- For VS Code:

Queries to Als_20260515(五)

```
bash
```

```
sudo snap install code --classic
```

13. Set up GitHub

- Create a GitHub account if you don't have one.
- Generate SSH keys for secure authentication:

```
bash
```

```
ssh-keygen -t ed25519 -C "your@email.com"
```

- Add the public key (~/.ssh/id_ed25519.pub) to GitHub under **Settings** → **SSH keys**.

Next Steps

- Practice cloning repositories:

```
bash
```

```
git clone https://github.com/username/repo.git
```

- Start a Django project to build your web app.
- Explore Linux basics (file system, permissions, package management).

👉 Would you like me to recommend **which Linux distribution** fits best for your Samsung notebook's age and specs, or do you already have one in mind?

For step 5 above, please tell me more about how to use Rufus (Windows)?

Rufus is a lightweight Windows utility that makes creating bootable USB drives very straightforward. Here's a clear step-by-step guide you can follow to prepare your Linux installer USB:

01

Download Rufus

Get the latest version directly from the official Rufus website.

- Visit the official Rufus site (rufus.ie)
- Download the **Standard** or **Portable** version (portable doesn't require installation)

02

Insert Your USB Drive

Connect the USB stick you'll use for the Linux installer.

- Use a USB drive with at least 4GB capacity
- Back up any files on it, as it will be erased

03

Launch Rufus

Open Rufus to access its main interface.

- If you downloaded the portable version, just double-click the `.exe`
- If you installed Rufus, open it from the Start menu

04

Select USB Device

Choose the correct USB drive in Rufus.

- In the **Device** dropdown, select your USB stick
- Double-check to avoid overwriting another drive

Queries to Als_20260515(五)

05

Choose Linux ISO

Point Rufus to the Linux distribution ISO you downloaded.

- Click **SELECT**
- Browse to the ISO file (e.g., Ubuntu ISO)
- Confirm selection

06

Set Partition Scheme

Match the scheme to your notebook's firmware (BIOS/UEFI).

- For most modern laptops: **GPT + UEFI**
- For older BIOS systems: **MBR + BIOS**
- Rufus usually auto-detects correctly

07

Start the Write Process

Create the bootable USB with your Linux installer.

- Click **START**
- Accept warnings about erasing data
- Wait until the status bar shows completion

08

Safely Remove USB

Once finished, eject the USB drive properly.

- Close Rufus
- Use Windows **Safely Remove Hardware** option
- Your USB is now ready to install Linux

✓ After this, you'll reboot your Samsung notebook, enter BIOS/UEFI, and boot from the USB to begin the Linux installation. Would you like me to also walk you through **BIOS/UEFI settings** (Secure Boot, boot order) so you're fully prepared for the installation?

After rebooting my Samsung notebook and typing F10, it shows a boot menu. there are two choices: windows boot manager and SATA HDD:: SAMSUNG M2MTD512HAGL-000. What are the next steps?

Great, you're at the boot menu stage. Right now, your notebook is only showing **Windows Boot Manager** and your internal hard drive (SATA HDD). That means the USB installer you created with Rufus isn't being detected yet. Here's how to proceed:

01

Check USB Creation

Ensure the Linux ISO was properly written to the USB using Rufus.

- Reinsert the USB into another computer and confirm it shows Linux installer files (not just the ISO file)
- If it only shows the ISO file, recreate the bootable USB in Rufus

02

Insert USB Before Boot Menu

The boot menu only lists devices connected at startup.

- Shut down the notebook completely
- Plug in the USB drive
- Power on and press **F10** again to open the boot menu

03

Look for USB Option

The boot menu should now list your USB drive.

- It may appear as the USB brand name (e.g., *SanDisk*, *Kingston*)
- Select it to boot into the Linux installer

04

Adjust BIOS/UEFI if Needed

Queries to Als_20260515(五)

If USB still doesn't appear, tweak BIOS settings.

- Enter BIOS with **F2** or **Del**
- Disable **Secure Boot**
- Enable **Legacy Boot/CSM** if available
- Ensure **USB boot** is enabled
- Save changes and retry

05

Begin Linux Installation

Once USB boots, follow the installer prompts.

- Choose **Install Linux**
- Select **Erase disk and install Linux** to remove Windows
- Create your username and password

Sources: General Linux installation best practices and Rufus usage guides.

👉 In short: recreate or verify your USB with Rufus, plug it in before powering on, and check BIOS settings if it doesn't show up. Once the USB option appears in the boot menu, select it to start installing Linux.

Would you like me to walk you through the **exact Rufus settings** (Partition scheme, Target system, File system) so your USB is guaranteed to boot on your Samsung notebook?
