20260519_00

I've formed a project team of three members: Developer A(DevA, myself), Developer B(DevB) and Developer C(DevC). They are living in different countries.

The project name is Li Jing Hostel, which is a web application where the backend is using Django. I am the project owner and have already set up Git in my MacBook and made link to my GitHub repository called li_jing_hostel. By using VSCode, I have made some code and finished basic settings for this Django project.

Both DevB and DevC are collaborators of this project. DevB is using a Windows notebook and DevC is using a Linux notebook. They have set up their own Git and GitHub as well as installed their own VSCode.

However, we have not done any other things about the project e.g. DevB and DevC have not installed Django nor other frontend tools, DevA(me) has not made invitation to DevB and DevC to join the project, ... etc.

Please list out all major steps for us before starting the project.

Got it — you're essentially at the “pre-flight checklist” stage before the Li Jing Hostel project can really take off. Since you already have the repo and basic Django setup, the next steps are about **team onboarding, environment setup, and workflow alignment**. Here's a structured roadmap:

Team & Collaboration Setup

- **Invite collaborators properly**
 - As project owner, formally invite DevB and DevC to the GitHub repo (Settings → Collaborators → Add people).
 - Confirm they accept and have push/pull permissions.
- **Define roles & responsibilities**
 - DevA (you): Project owner, backend lead.
 - DevB: Windows dev — could focus on frontend or testing.
 - DevC: Linux dev — could focus on deployment or backend support.
 - Agree on division of tasks before coding starts.
- **Communication channels**
 - Set up a shared platform (Slack, Teams, Discord) for daily updates.
 - Decide on meeting cadence (weekly sync, ad-hoc standups).

Environment Setup

Queries to Als_20260519(二)

- **Common requirements**
 - All developers install Python (same major version, e.g., 3.11).
 - Install Django (`pip install django`).
 - Install Git and VSCode extensions (Python, Django, GitHub Copilot if desired).
- **OS-specific notes**
 - DevB (Windows): Ensure `pip` and virtual environments work (`python -m venv venv`).
 - DevC (Linux): Use system package manager for Python if needed, then set up `virtualenv`.
 - DevA (Mac): Already set up, but confirm `virtualenv` usage for consistency.
- **Frontend tools**
 - Decide on framework (React, Vue, or plain HTML/CSS/JS).
 - Install Node.js and npm/yarn across all machines if frontend is required.

Project Structure & Standards

- **Repository organization**
 - Create clear folder structure (`backend/`, `frontend/`, `docs/`).
 - Add `.gitignore` (ignore `venv/`, `__pycache__`, `.env`).
- **Branching strategy**
 - Main branch: stable code.
 - Dev branches: feature branches per developer.
 - Pull requests required for merging.
- **Coding conventions**
 - Agree on style guide (PEP8 for Python, ESLint/Prettier for JS).
 - Document in `CONTRIBUTING.md`.

Security & Configuration

- **Environment variables**
 - Use `.env` files for secrets (database URL, API keys).
 - Never commit `.env` to GitHub.
- **Database setup**
 - Decide on DB (SQLite for dev, PostgreSQL/MySQL for production).
 - Ensure migrations workflow is clear (`python manage.py makemigrations && migrate`).

Workflow & Next Steps

1. DevA: Finalize repo setup, invite collaborators.
2. DevB & DevC: Clone repo, set up Python/Django environment.
3. All: Run initial Django server (`python manage.py runserver`) to confirm setup.
4. Agree on first milestone (e.g., user authentication module).

Queries to Als_20260519(二)

5. Document tasks in GitHub Issues or Project board.

👉 This checklist ensures everyone is aligned before writing serious code. Would you like me to **draft a step-by-step onboarding guide for DevB and DevC** (like a mini manual they can follow to get their laptops ready), so you can send it to them directly?
